Algorithms and Data Structures

Content and Basic Notions

Algorithms and Data Structures

A continuation of Introduction to Algorithms and Data Structures (INF2 - IADS).

Mostly same techniques, more advanced applications.

Divide-and-Conquer, Greedy, Dynamic Programming

More emphasis on "Algorithms" rather than "Data Structures".

More theorem proving.

Review of algorithm design basics, including *time and* space complexity, and asymptotic notation.

Review of algorithm design basics, including *time and* space complexity, and asymptotic notation.

The *divide-and-conquer* paradigm:

Review of algorithm design basics, including *time and* space complexity, and asymptotic notation.

The divide-and-conquer paradigm:

Sorting, matrix multiplication, Fourier transform.

Review of algorithm design basics, including *time and* space complexity, and asymptotic notation.

The divide-and-conquer paradigm:

Sorting, matrix multiplication, Fourier transform.

Upper and lower bound proofs.

Review of algorithm design basics, including *time and* space complexity, and asymptotic notation.

The divide-and-conquer paradigm:

Sorting, matrix multiplication, Fourier transform.

Upper and lower bound proofs.

Solving recurrence relations.

The *greedy* paradigm:

The *greedy* paradigm:

Minimum spanning trees.

The *greedy* paradigm:

Minimum spanning trees.

Network flows.

The *greedy* paradigm:

Minimum spanning trees.

Network flows.

Linear programming.

The *greedy* paradigm:

Minimum spanning trees.

Network flows.

Linear programming.

The *dynamic programming* paradigm:

The *greedy* paradigm:

Minimum spanning trees.

Network flows.

Linear programming.

The *dynamic programming* paradigm:

Matrix-chain multiplication and other examples.

What is an algorithm?

A set of instructions for solving a problem or performing a computation.

Origin of the name: Latinisation of the name given by Persian scholar Muhammad ibn Musa al-Khwarizmi.

2	4			

Given a sequence of numbers, put them in increasing order.

2				

Is 2 < 6?

2	4			

6				

6				

Given a sequence of numbers, put them in increasing order.

6				

Is 19 < 6?

6				

6				

Given a sequence of numbers, put them in increasing order.

				and the state of t					
2	6	19	4	10	1	17	14	21	24

Is 4 < 19?

6				

6				

2	6	4	19	10	1	17	14	21	24

6				

4				

4				

4				

2	4	6	19	10	17	14	21	24

Given a sequence of numbers, put them in increasing order.

2	4	6	19	10	1	17	14	21	24

continues the same way...

Example: Sorting

Given a sequence of numbers, put them in increasing order.

1	2	4	6	10	14	17	19	21	24

continues the same way...

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A]

2. DO key \leftarrow A[j]

3. {Put A[j] into the sorted sequence A[1 ... j-1]}

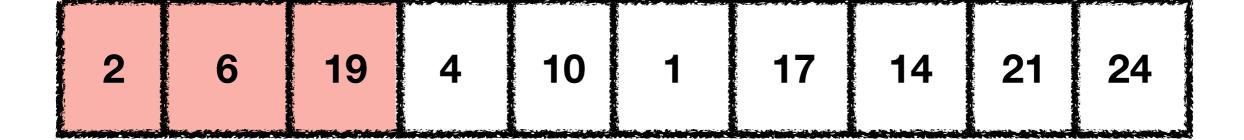

4. i \leftarrow j-1

5. WHILE i > 0 and A[i] > \text{key}

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

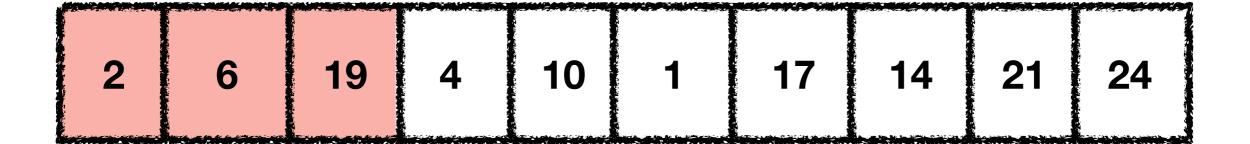

8. A[i+1] \leftarrow \text{key}
```

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A]

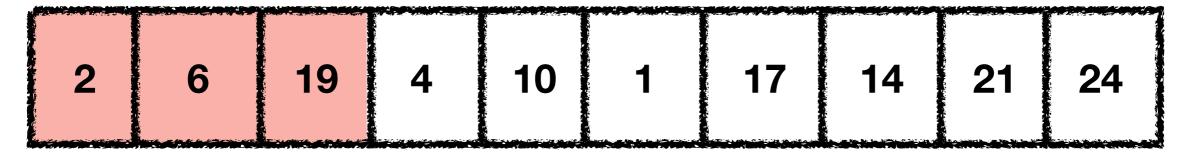

2. DO key \leftarrow A[j]
3. {Put A[j] into the sorted sequence A[1 ... j - 1]}
4. i \leftarrow j - 1
5. WHILE i > 0 and A[i] > \text{key}
6. DO A[i+1] \leftarrow A[i]
7. i \leftarrow i - 1
8. A[i+1] \leftarrow \text{key}
```

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A]

2. DO key \leftarrow A[j]
3. {Put A[j] into the sorted sequence A[1 ... j - 1]}
4. i \leftarrow j - 1
5. WHILE i > 0 and A[i] > \text{key}
6. DO A[i+1] \leftarrow A[i]
7. i \leftarrow i - 1
8. A[i+1] \leftarrow \text{key}
```

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A]

2. DO key \leftarrow A[j]

3. {Put A[j] into the sorted sequence A[1 ... j-1]}

4. i \leftarrow j-1

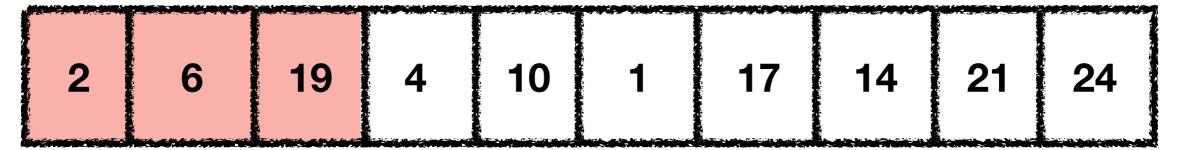

5. WHILE i > 0 and A[i] > \text{key}

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key}
```

The algorithm maintains a sorted array in each iteration (each time the for loop is executed).

j=4

```

```

What should we expect from algorithms?

Correctness: It computes the desired output.

Termination: Eventually terminates (or with high probability).

Efficiency:

The algorithm runs *fast* and/or uses *limited memory*.

The algorithm produces a "good enough" outcome.

How do we prove that our algorithm is always correct?

How do we prove that our algorithm is always correct?

Proof techniques (induction, proof-by-contradiction etc).

How do we prove that our algorithm is always correct?

Proof techniques (induction, proof-by-contradiction etc).

For those of you that took INF2-IADS: You did this a lot there!

Best case? Sorted array, $\,t_{j}=1\,$

Bounded by some cn for some constant c

Worst case? Reverse sorted array, $\,t_{j}=j\,$

Bounded by some cn^2 for some constant c

Each memory cell can hold one element of the input.

Each memory cell can hold one element of the input.

Total memory usage = Memory used to hold the input + extra memory used by the algorithm (auxiliary memory).

Each memory cell can hold one element of the input.

Total memory usage = Memory used to hold the input + extra memory used by the algorithm (auxiliary memory).

Q: What is the total and the auxiliary memory usage of InsertionSort?

Convention: When we say "the running time of Algorithm A", we mean the worst-case running time, over all possible inputs to the algorithm.

Convention: When we say "the running time of Algorithm A", we mean the worst-case running time, over all possible inputs to the algorithm.

We can also measure the best-case running time, over all possible inputs to the problem.

Convention: When we say "the running time of Algorithm A", we mean the worst-case running time, over all possible inputs to the algorithm.

We can also measure the best-case running time, over all possible inputs to the problem.

In between: average-case running time.

Running time of the algorithm on inputs which are chosen at random from some distribution.

The appropriate distribution depends on the application (usually the uniform distribution - all inputs equally likely).

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 . . j - 1]}

4. i \leftarrow j - 1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i - 1

8. A[i+1] \leftarrow \text{key n-1 times}
```

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 . . j - 1]}

4. i \leftarrow j - 1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key n-1 times}
```

for loops, the tests are executed one more time than the loop body

Select an input uniformly at random from all possible sequences with n numbers.

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 . . j - 1]}

4. i \leftarrow j - 1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key n-1 times}
```

for loops, the tests are executed one more time than the loop body

Select an input uniformly at random from all possible sequences with n numbers.

On average, key will be smaller than half of the elements in A[1,...,j].

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 . . j - 1]}

4. i \leftarrow j - 1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key n-1 times}
```

for loops, the tests are executed one more time than the loop body

Select an input uniformly at random from all possible sequences with n numbers.

On average, key will be smaller than half of the elements in A[1,...,j].

The while loop will look "halfway" through the sorted subarray A[1,...,j].

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 . . j - 1]}

4. i \leftarrow j - 1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key n-1 times}
```

for loops, the tests are executed one more time than the loop body

Select an input uniformly at random from all possible sequences with n numbers.

On average, key will be smaller than half of the elements in A[1,...,j].

The while loop will look "halfway" through the sorted subarray A[1,...,j].

This means that
$$t_j = rac{j}{2}$$

```
INSERTION_SORT (A)

1. FOR j \leftarrow 2 TO length[A] n times

2. DO key \leftarrow A[j] n-1 times

3. {Put A[j] into the sorted sequence A[1 ...j-1]}

4. i \leftarrow j-1 n-1 times

5. WHILE i > 0 and A[i] > \text{key} \sum_{j=2}^{n} t_j times

6. DO A[i+1] \leftarrow A[i]

7. i \leftarrow i-1

8. A[i+1] \leftarrow \text{key n-1 times}
```

for loops, the tests are executed one more time than the loop body

Select an input uniformly at random from all possible sequences with n numbers.

On average, key will be smaller than half of the elements in A[1,...,j].

The while loop will look "halfway" through the sorted subarray A[1,...,j].

This means that
$$t_j = rac{j}{2}$$

Bounded by some cn^2 for some constant c

Asymptotic Notation

When n becomes large, it makes less of a difference if an algorithm takes 2n or 3n steps to finish.

In particular, 3logn steps are fewer than 2n steps.

We would like to avoid having to calculate the precise constants.

We use asymptotic notation (next lecture).
