## **IR Evaluation**

Instructor: Walid Magdy

15-Oct-2025

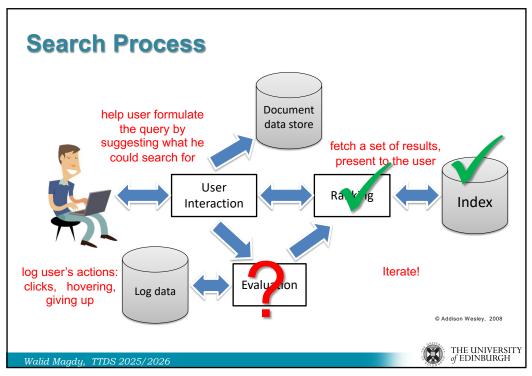

1

### **Lecture Objectives**

- Learn about how to evaluate IR
  - Evaluation measures
  - P, R, F
  - MAP
  - nDCG
- Implement: (as part of CW2)
  - P, R
  - MAP
  - nDCG

Walid Magdy, TTDS 2025/2026

#### IR as an Experimental Science!

- Formulate a research question: the hypothesis
- Design an experiment to answer the question
- Perform the experiment
  - Compare with a baseline "control"
- Does the experiment answer the question?
  - Are the results significant? Or is it just luck?
- Report the results!
- Iterate ...
- e.g. stemming improves results? (university → univers)

Walid Magdy, TTDS 2025/2026

Л

Walid Magdy, TTDS 2025/2026		THE UNIVERSITY of EDINBURGH

#### **Configure your system**

- About the system:
  - Stopping? Tokenise? Stemming? n-gram char?
  - Use synonyms improve retrieval performance?
- Corresponding experiment?
  - Run your search for a set of queries with each setup and find which one will achieve the best performance
- About the user:
  - Is letting users weight search terms a good idea?
- Corresponding experiment?
  - Build two different interfaces, one with term weighting functionality, and one without; run a user study

Walid Magdy, TTDS 2025/2026

#### **Types of Evaluation Strategies**

- System-centered studies:
  - Given documents, queries, and relevance judgments
  - Try several variations of the system
  - · Measure which system returns the "best" hit list
  - Laboratory experiment
- User-centered studies
  - · Given several users, and at least two retrieval systems
  - · Have each user try the same task on both systems
  - Measure which system works the "best"

Walid Magdy, TTDS 2025/2026

7

#### **Importance of Evaluation**

- The ability to measure differences underlies experimental science
  - How well do our systems work?
  - Is A better than B?
  - Is it really?
  - Under what conditions?
- Evaluation drives what to research
  - Identify techniques that work and don't work

Walid Magdy, TTDS 2025/2026

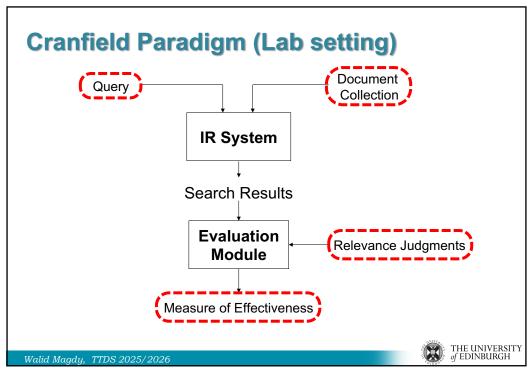

#### The 3-dimensions of Evaluation

- Effectiveness
  - How "good" are the documents that are returned?
  - System only, human + system
- Efficiency
  - Retrieval time, indexing time, index size
- Usability
  - Learnability, flexibility
  - Novice vs. expert users

THE UNIT OF EDINBU

Walid Magdy, TTDS 2025/2026

9

#### **Reusable IR Test Collection**

- Collection of Documents
  - Should be "representative" to a given IR task
  - Things to consider: size, sources, genre, topics, ...
- Sample of information need
  - Should be "randomized" and "representative"
  - Usually formalized <u>topic</u> statements (query + description)
- Known relevance judgments
  - · Assessed by humans, for each topic-document pair
  - Binary/Graded
- Evaluation measure

Walid Magdy, TTDS 2025/2026

11

#### **Good Effectiveness Measures**

- Should capture some aspect of what the user wants
  - IR → Do the results satisfy user's information need?
- Should be easily replicated by other researchers
- Should be easily comparable
  - Optimally, expressed as a single number
    - Curves and multiple numbers are still accepted, but single numbers are much easier for comparison
- Should have predictive value for other situations
  - What happens with different queries on a different document collection?

THE UNIVERSITY of EDINBURGH

Walid Magdy, TTDS 2025/2026

#### **Set Based Measures**

- Assuming IR system returns sets of retrieved results without ranking
- Suitable with Boolean Search
- No certain number of results per query

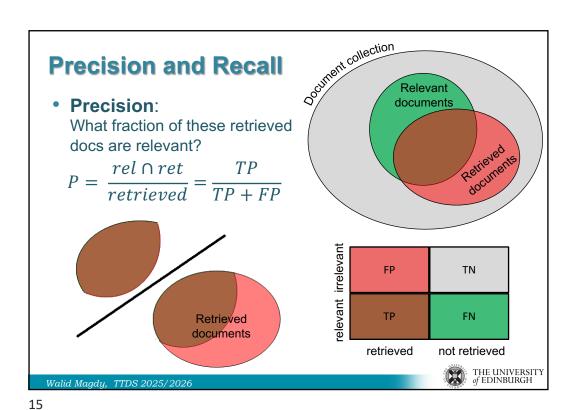

adu, TTDS 2025/2026 THE UNIVER

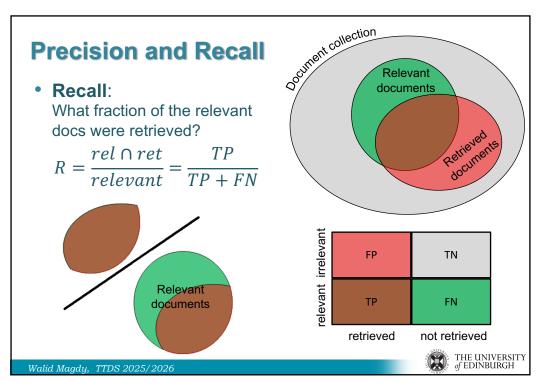

13

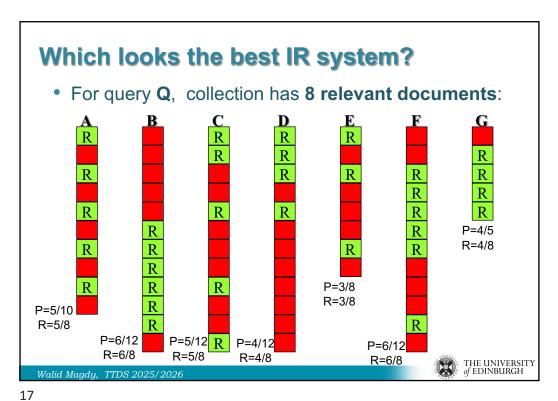

Which looks the best IR system?

For query Q, collection has 8 relevant documents:

#### Trade-off between P & R

- Precision: The ability to retrieve top-ranked docs that are mostly relevant.
- Recall: The ability of the search to find all of the relevant items in the corpus.
- Retrieve more docs:
  - Higher chance to find all relevant docs → R ↑↑
  - Higher chance to find more irrelevant docs → P ↓↓

Walid Magdy, TTDS 2025/2026

#### One Measure? F-measure

$$F1 = \frac{2 \cdot P \cdot R}{P + R}$$

$$F_{\beta} = \frac{(\beta^2 + 1)P \cdot R}{\beta^2 P + R}$$

- Harmonic mean of recall and precision
  - Emphasizes the importance of small values, whereas the arithmetic mean is affected more by outliers that are unusually large
- Beta (β) controls relative importance of P and R
  - $\beta$  = 1, precision and recall equally important  $\rightarrow$  F1
  - $\beta$  = 5, recall five times more important than precision

Walid Magdy, TTDS 2025/2026

21

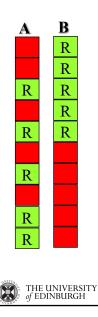

#### F-measure?

• For query Q, collection has 8 relevant documents:

	System	Precision	Recall	F1 I	F5	F0.5	F0
	Α	0.500	0.625	0.556	0.619	0.521	0.500
	В	0.500	0.750	0.600	0.736	0.536	0.500

Walid Magdy, TTDS 2025/2026  R=6/8  THE UNIVERS of EDINBURGH							

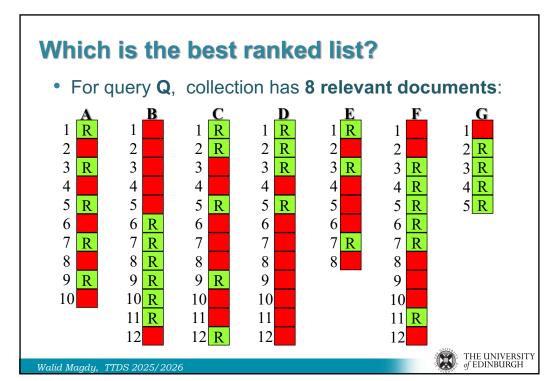

#### **Rank-based IR measures**

- Consider systems A & B
  - Both retrieved 10 docs, only 5 are relevant
  - P, R & F are the same for both systems
    Should their performances considered equal?
- Ranked IR requires taking "<u>ranks</u>" into consideration!
- How to do that?

Walid Magdy, TTDS 2025/2026

23

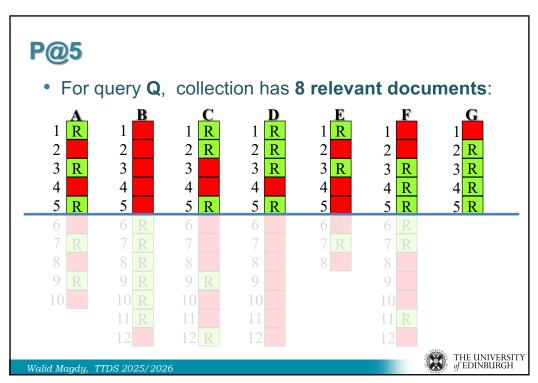

#### Precision @ K

- *k* (a fixed number of documents)
- Have a cut-off on the ranked list at rank *k*, then calculate precision!
- Perhaps appropriate for most of web search: most people only check the top k results
- But: averages badly, Why?

THE UNIVERSIT

Walid Magdy, TTDS 2025/2026

25

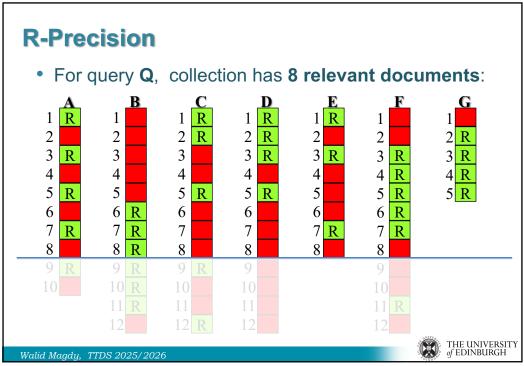

#### **R-Precision**

- For a query with known r relevant documents
   → R-precision is the precision at rank r (P@r)
- *r* is different from one query to another
- Concept:
   It examines the ideal case: getting all relevant documents in the top ranks
- Is it realistic?

Walid Magdy, TTDS 2025/2026

27

#### **User Satisfaction??**

- It is assumed that users needs to find relevant docs at the highest possible ranks
  - → Precision is a good measure
- But, user would cut-off (stop inspecting results) at some point, say rank x
   →P@x
- What is the optimal x?When you think a user can stop?

Walid Magdy, TTDS 2025/2026

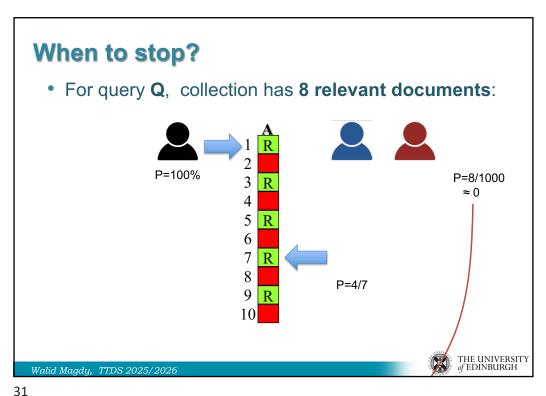

29

#### When can a user stop?

- IR objective: "satisfy user information need"
- Assumption: a user will stop once their information need is satisfied
- How? user will keep looking for relevant docs in the ranked list, read them, then stop once they feels satisfied
- P@x →x can be any rank where a relevant document appeared (assume uniform distribution)

Walid Magdy, TTDS 2025/2026

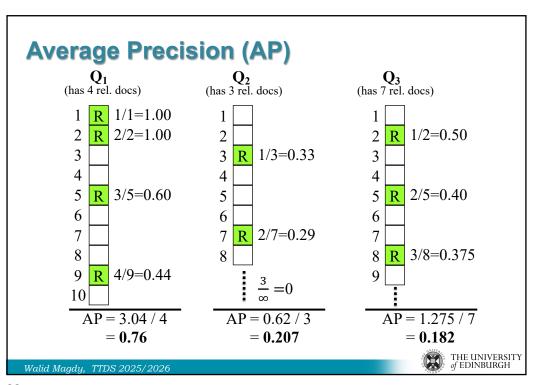

Э1

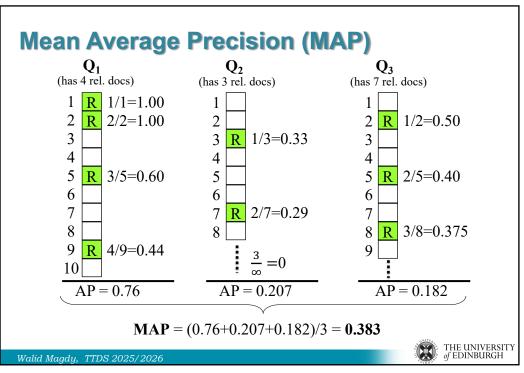

#### When a user can stop?

- IR objective: "satisfy user information need"
- Assumption: a user will stop once his/her information need is satisfied
- How? user will keep looking for relevant docs in the ranked list, read them, then stop once he/she feels satisfied
- P@x →x can be any rank where a relevant document appeared (assume uniform distribution)
- What about calculating the averages over all x's?
  - every time you find relevant doc, calculate P@x, then take the average at the end

Walid Magdy, TTDS 2025/2026

#### AP & MAP

$$AP = \frac{1}{r} \sum_{k=1}^{n} P(k) \times rel(k)$$

where, r: number of relevant docs for a given query n: number of documents retrieved P(k) precision @ k

rel(k): 1 if retrieved doc @ k is relevant, 0 otherwise.

$$MAP = \frac{1}{Q} \sum_{q=1}^{Q} AP(q)$$

where, Q: number of queries in the test collection

THE UNIVERSITY of EDINBURGH

Walid Magdy, TTDS 2025/2026

35

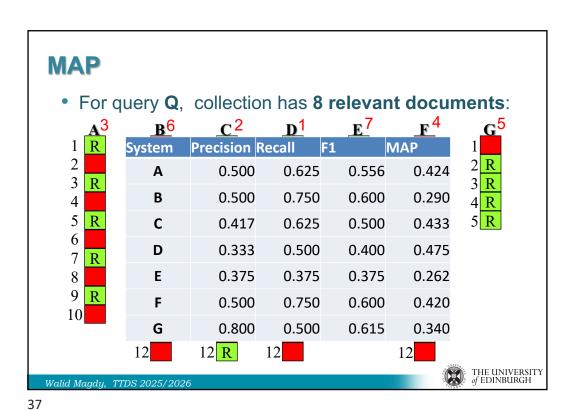

#### AP/MAP

$$AP = \frac{1}{r} \sum_{k=1}^{n} P(k) \times rel(k)$$

- A mix between precision and recall
- Highly focus on finding relevant document as early as possible
- When  $r=1 \rightarrow MAP = MRR$  (mean reciprocal rank  $\frac{1}{k}$ )
- MAP is the most commonly used evaluation metric for most IR search tasks
- Uses binary relevance: rel = 0/1

THE UNIVERSITY of EDINBURGH

Walid Magdy, TTDS 2025/2026

**Binary vs. Graded Relevance** 

- Some docs are more relevant to a query than other relevant ones!
  - We need non-binary relevance
- Binary Relevance:
  - Relevant 1
  - Irrelevant 0
- Graded Relevance:
  - Perfect 4
  - Excellent 3
  - Good 2
  - Fair 1
  - Bad **0**

Walid Magdy, TTDS 2025/2026

#### **Binary vs. Graded Relevance**

- Two assumptions:
  - Highly relevant documents are more useful than marginally relevant
  - The lower the ranked position of a relevant document, the less useful it is for the user, since it is less likely to be examined
- Discounted Cumulative Gain (DCG)
  - Uses graded relevance as a measure of the usefulness
  - The most popular for evaluating web search

THE UNIVERSIT

Walid Magdy, TTDS 2025/2026

39

#### **Discounted Cumulative Gain (DCG)**

- Gain is accumulated starting at the top of the ranking and may be reduced (<u>discounted</u>) at lower ranks
- Users care more about high-ranked documents, so we discount results by 1/log<sub>2</sub>(rank)
  - the discount at rank 4 is 1/2, and at rank 8 is 1/3
- DCG<sub>k</sub> is the total gain accumulated at a particular rank
   k (sum of DG up to rank k):

$$DCG_k = rel_1 + \sum_{i=2}^k \frac{rel_i}{\log_2(i)} (g_{raded})^{rel}$$

Walid Magdy, TTDS 2025/2026

#### **DCG** DG DCG@k G 3 3 2 5 1.89 6.89 3 4 6.89 0 6.89 0.39 7.28 6 7 0.71 7.99 0.67 8 8.66 0.95 9.61 10 0 9.61

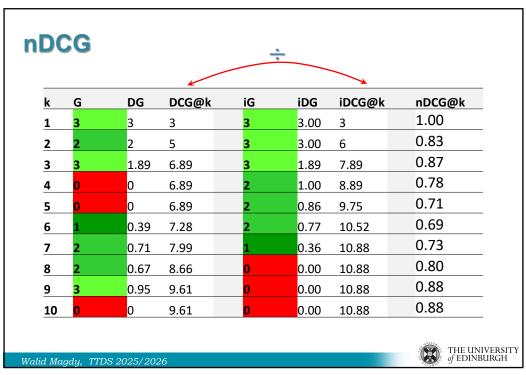

41

#### **Normalized DCG (nDCG)**

- DCG numbers are averaged across a set of queries at specific rank values (DCG@k)
  - e.g., DCG at rank 5 is 6.89 and at rank 10 is 9.61
  - Can be any positive real number!
- DCG values are often normalized by comparing the DCG at each rank with the DCG value for the perfect ranking
  - makes averaging easier for queries with different numbers of relevant documents
- nDCG@k = DCG@k / iDCG@k (divide actual by ideal)
- nDCG ≤ 1 at any rank position
- To compare DCGs, normalize values so that a ideal ranking would have a normalized DCG of 1.0

Walid Magdy, TTDS 2025/2026

#### **Summary:**

- IR test collection:
  - Document collection
  - Query set
  - Relevant judgements
  - IR measures
- IR measures:
  - R, P, F → not commonly used
  - P@k, R-precision → used sometimes
  - MAP → the most used IR measure
  - nDGC → the most used measure for web search

Walid Magdy, TTDS 2025/2026
