

# Mock exam and mid-course revision

WHEN ASKED HOW MY PREP IS GOING

S01E06

*I was going for 'quiet desperation'.*

300HOURS.COM

# LEARNING OUTCOMES

Revise the material of the first part of the course

Prepare for the exam

# CONTEXT

Congratulations!

You have just been **hired by DBBA Bank**, a digital bank with a lot of customers throughout the UK

# CONTEXT

Your first task is to **analyse a network of financial transactions** with the **goal of spotting money laundering**.

Your data contain **all transactions from all the DBBA Bank's customers**. This includes payments, transactions between customers, and money transfers between different accounts (remember that a customer may have more than one account).

# QUESTION 1

Describe how you would model the data as a network. Do so by answering the following questions:

- i. What type of network would this be (e.g., single-layer, multipartite, tree, etc.)?
- ii. What do the nodes represent?
- iii. What do the links represent?
- iv. Is the network weighted or unweighted?
- v. Is the network directed or undirected?

Clearly state your assumptions and justify all your answers!

# QUESTION 1

**What type of network would this be (e.g., single-layer, multipartite, tree, etc.)?**

# QUESTION 1

**What do the nodes represent?**

# QUESTION 1

**What do the links represent?**

# QUESTION 1

**Is the network weighted or unweighted?**

# QUESTION 1

**Is the network directed or undirected?**

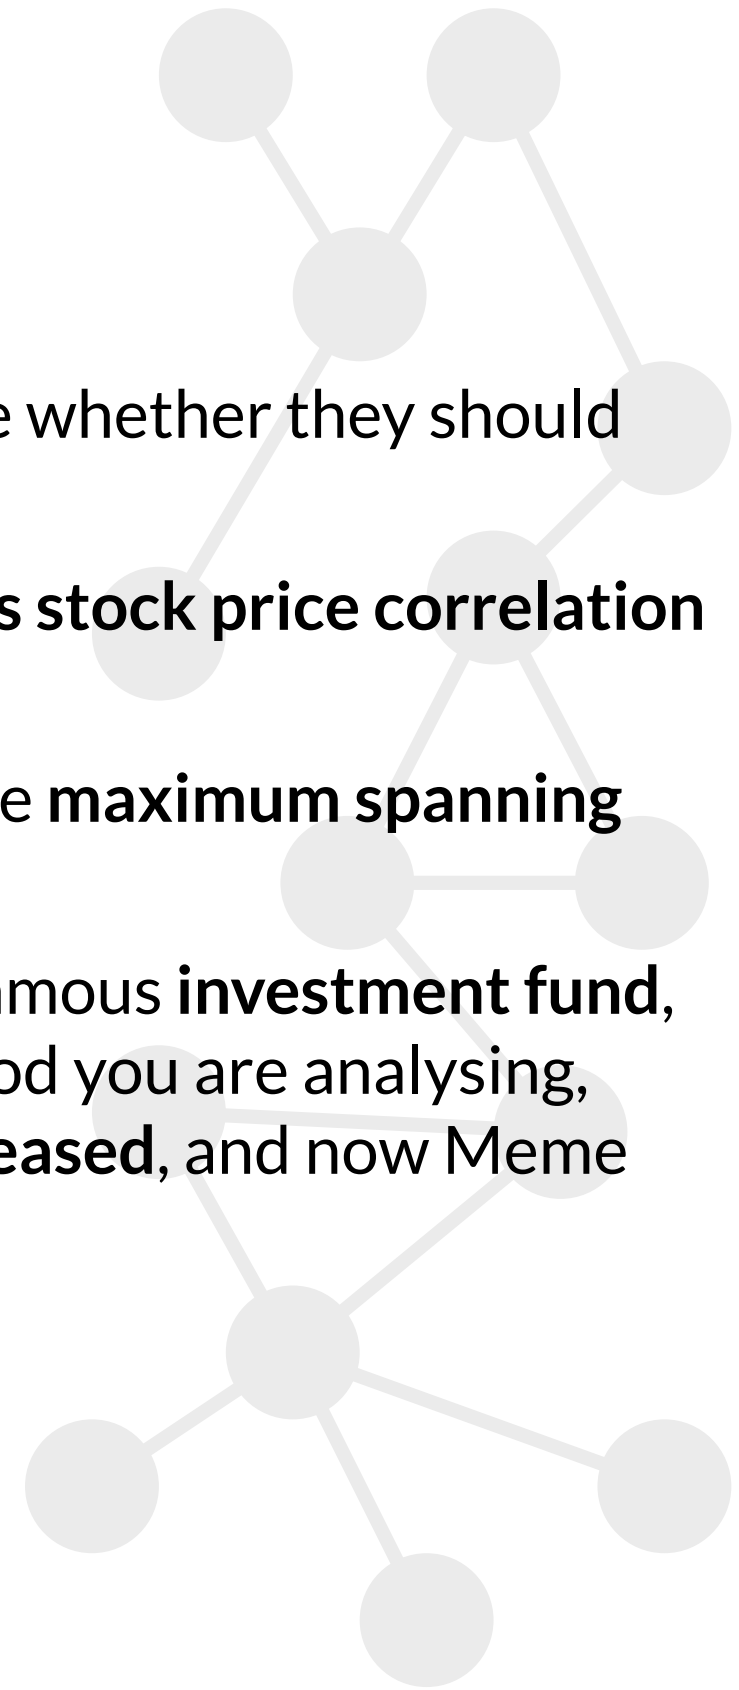

# QUESTION 2

Given the current economic turmoil, DBBA Bank wants to explore whether they should **change their asset allocation**.

To do so, you are asked to perform a **temporal analysis of the UK's stock price correlation network**.

Since you have attended DBBA, you decide to do so by building the **maximum spanning tree of the network for each month of data in the last year**.

While doing your analysis, you notice one thing: Meme Invest, a famous **investment fund**, was the **most central node** in the tree at the beginning of the period you are analysing, forming a **super star**. However, **its degree has progressively decreased**, and now Meme Invest is **not even a hub** anymore.

# QUESTION 2

**Given what you know about Meme Invest and its position in the network, what could be the cause of its degree dropping?**

# QUESTION 2

**How can DBBA Bank use this result?**

# QUESTION 3

The **unweighted, directed** network below is DBBA Bank's **ego-network of interbank loan**. Each node represents a bank. A link from  **$i$  to  $j$**  means that  **$i$  lends money to  $j$** . Answer the following questions:

# QUESTION 4

# QUESTION 4

List the nodes that belong to the largest weakly connected component and the nodes that belong to the largest strongly connected component. Justify your answer.

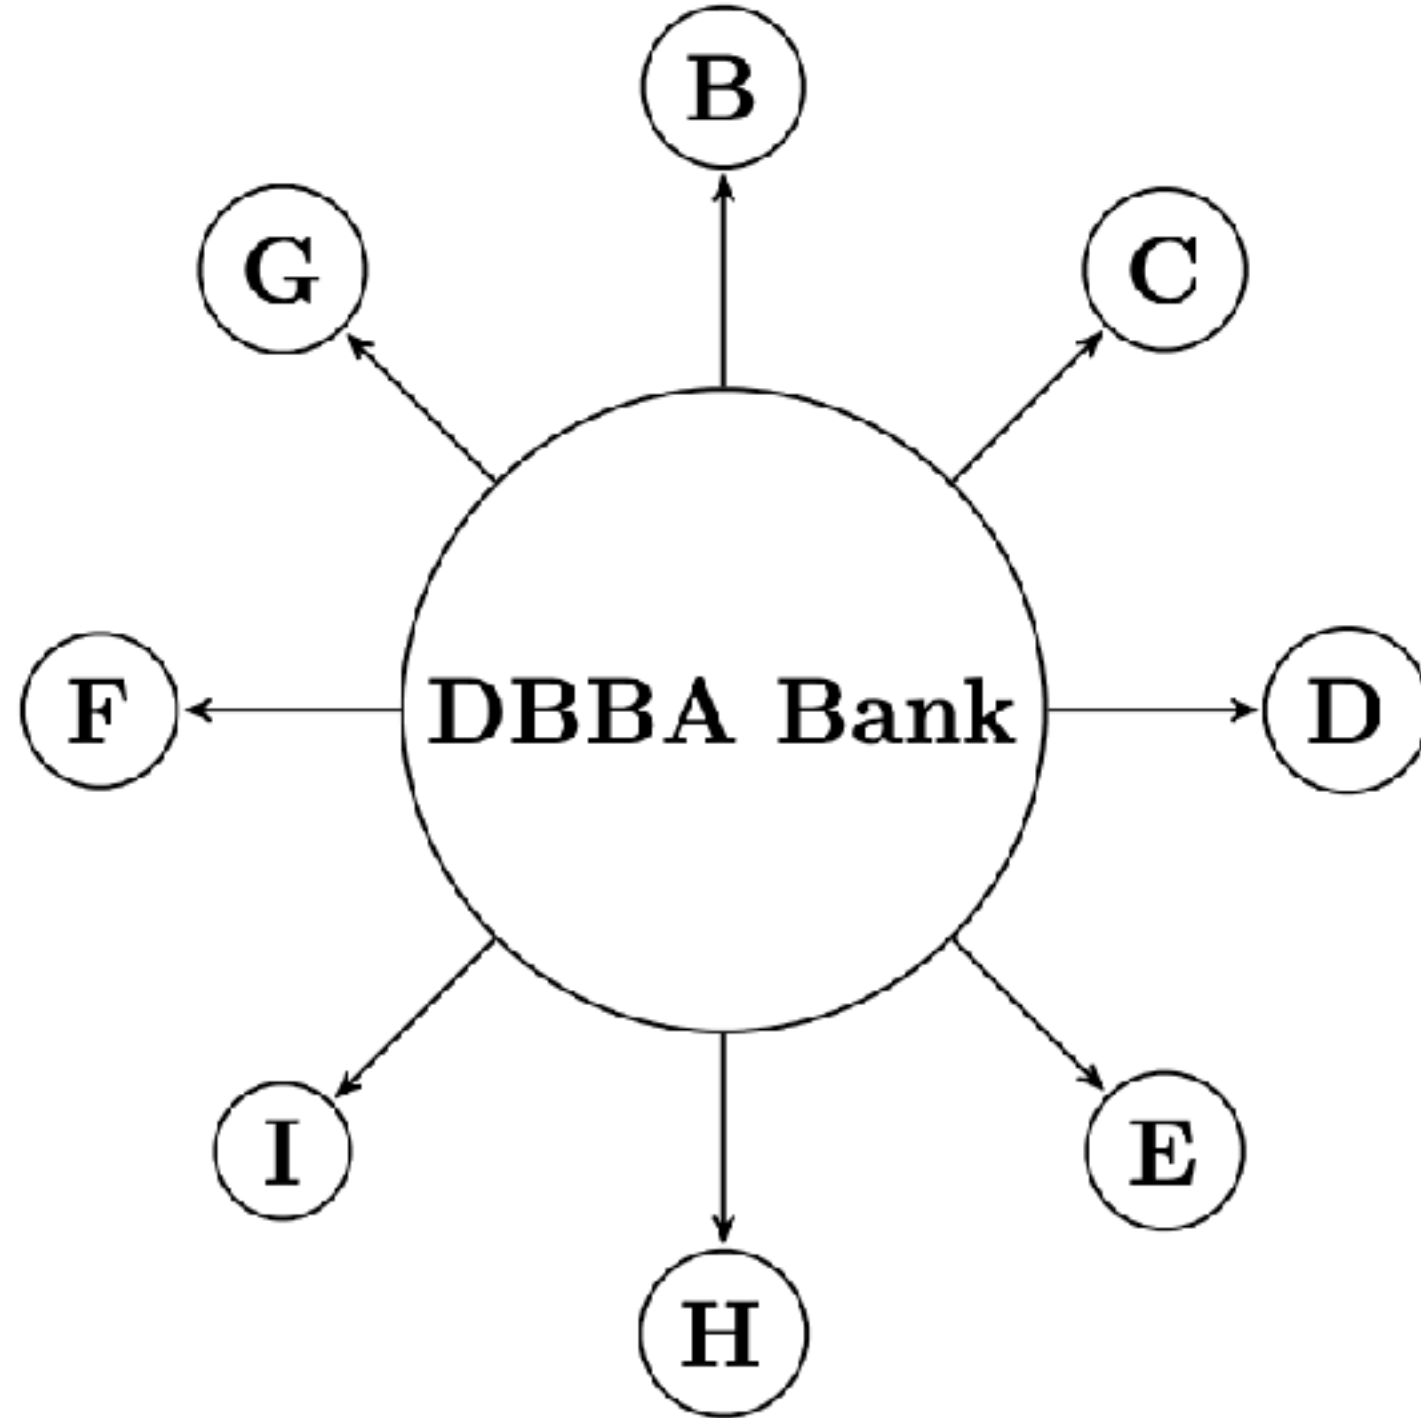

# QUESTION 4

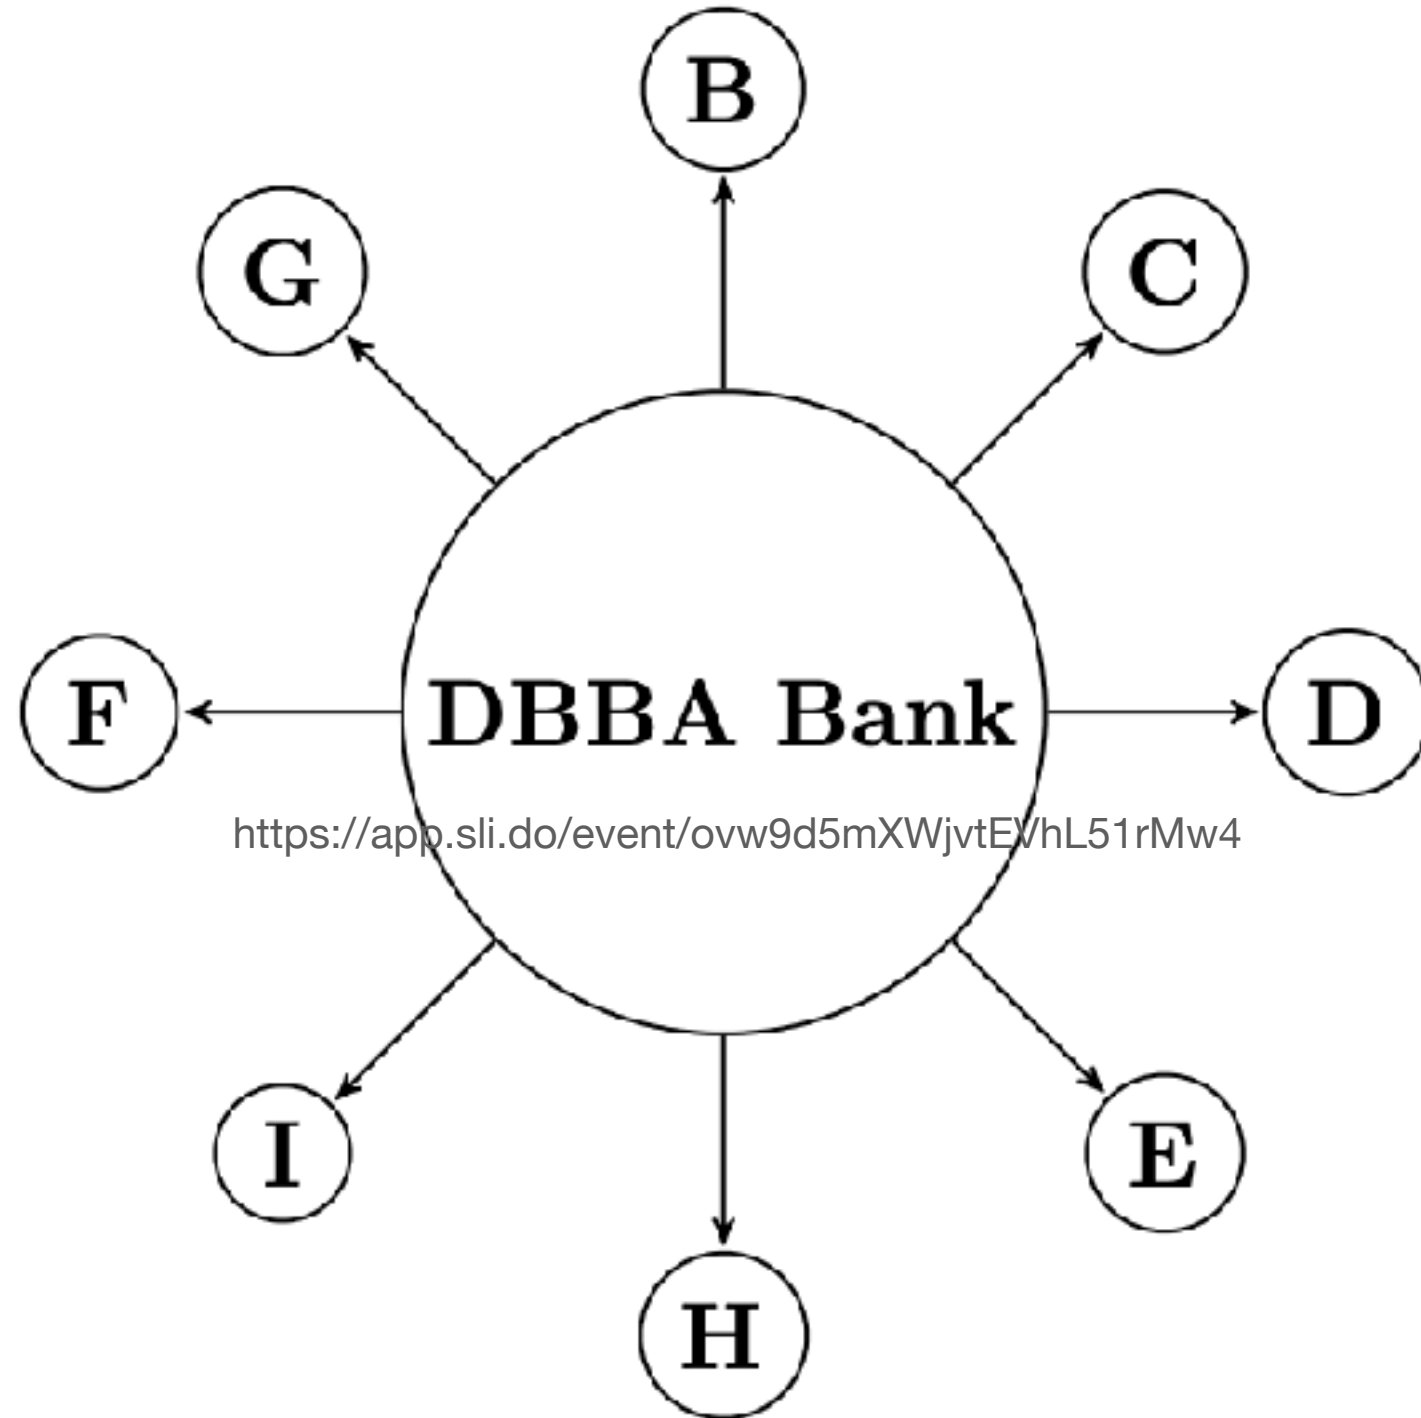

Comment on the centrality of the nodes in the network.

# QUESTION 4

Discuss the robustness of the network (maximum five sentences)

# QUESTION 4

In case of a systemic shock, which bank would be the most affected?  
State your assumptions (if any) and justify your answer.
