Overview

Importance

Content

Organization

Please also look at Alley’s web site, which has a lot of videos and additional materials: https://www.craftofscientificwriting.com/
In previous sessions on scientific writing, we talked about:

- audience, purpose, occasion
- precision and clarity
- structure

In this session, we will apply what we’ve learned to one of the most important parts of a paper: the abstract.
Importance
Why is the Abstract Important?

For readers:

- find out what the paper is about (beyond the information in the title)
- get a summary of the most important findings
- decide whether they want to read the paper or not

For reviewers:

- find out whether the paper is within their area of expertise
- decide whether they want to review the paper or not
- form a first opinion about the quality of the paper

Many readers will only read the title and the abstract. So this is the one chance to get your message across!
Why is the Abstract Important?

The abstract can also be a tool for the writer:

- helps you decide what your most important points are
- helps you clarify the overall argumentation of the paper
- provides a way of repeating important information
- allows you to influence who will read (and review!) the paper
Content
According to Alley (who calls it summary), the abstract should:

- contain the most important points of the paper
- contain *only* the important points
- only include material that occurs elsewhere in the paper (verbatim or paraphrased)
- be self-contained, i.e., the reader should be able to understand the abstract without having to read anything else
- this means unusual terms, techniques, etc. need to be explained in the abstract
- don’t assume all readers will be specialists in the topic of the paper; assume a broad readership.
Alley distinguishes:

- **informative summary**: describes the most important results of a paper;
- **descriptive summary**: states what kind of information the paper provides (like a table of contents), but doesn’t give the actual results.

The abstract of a conference or journal paper is a mixture of both: it provides signposting (which information to expect in the paper), but also summarizes the results.
Zobel offers the following practical advice:

- the abstract is typically a single paragraph of about 50–200 words
- it presents a summary of the paper’s aims, scope, and conclusions
- do not use acronyms, mathematics, abbreviations, citations (the abstract should be self-contained!)
- be as specific as possible (instead of *we improve the state of the art*, write things like *we improve the state of the art by 3.5%*)
- but only include **important** details.
Organization
Zobel suggests to start by writing one sentence on each of the following:

1. A general statement introducing the broad research area.
2. An explanation of the specific problem to be solved.
4. An outline of the proposed new solution.
5. A summary of how the solution was evaluated and the result of the evaluation.

So you start with five sentences, but then you can add additional sentences, re-write the ones you have, merge them, etc.
Organization of the Abstract

My own experience shows:

- longer documents may require longer abstracts: the abstract of a journal paper is somewhat longer than that of a conference paper
- the abstract of a PhD thesis is typically a whole page; it should summarize each (content) chapter
- abstracts can contain sentences extracted from the main body of the text (you may need to edit them for coherence)
- but: it is sometimes a good strategy to write the abstract before writing the paper – helps planning the overall argumentation, deciding what to focus on
- and then once the paper is finished, you need to completely re-write the abstract!
Over to You
Exercise 1: Evaluating an Abstract

Look at the abstracts on the next pages. Investigate the following questions:

1. Does the abstract follow Zobel’s structure?
2. Is it targeted at a general reader? Is it self-contained?
3. Does it avoid acronyms, mathematics, abbreviations, citations?
4. Does it contain (only) the most important points of the paper?
5. Is enough detail provided, and is all the detail important?

All abstracts are from papers that appeared at ACL 2020.
Exercise 1: Evaluating an Abstract

Abstract of Li et al. (2020):

Recently many efforts have been devoted to interpreting the black-box NMT models, but little progress has been made on metrics to evaluate explanation methods. Word Alignment Error Rate can be used as such a metric that matches human understanding, however, it can not measure explanation methods on those target words that are not aligned to any source word. This paper thereby makes an initial attempt to evaluate explanation methods from an alternative viewpoint. To this end, it proposes a principled metric based on fidelity in regard to the predictive behavior of the NMT model. As the exact computation for this metric is intractable, we employ an efficient approach as its approximation. On six standard translation tasks, we quantitatively evaluate several explanation methods in terms of the proposed metric and we reveal some valuable findings for these explanation methods in our experiments.
Abstract of Yang et al. (2020):

We present easy-to-use retrieval focused multilingual sentence embedding models, made available on TensorFlow Hub. The models embed text from 16 languages into a shared semantic space using a multi-task trained dual-encoder that learns tied cross-lingual representations via translation bridge tasks (Chidambaram et al., 2018). The models achieve a new state-of-the-art in performance on monolingual and cross-lingual semantic retrieval (SR). Competitive performance is obtained on the related tasks of translation pair bitext retrieval (BR) and retrieval question answering (ReQA). On transfer learning tasks, our multilingual embeddings approach, and in some cases exceed, the performance of English only sentence embeddings.

This was a system demonstration paper. How does that affect the writing?
Abstract

Opinion summarization is the task of automatically creating summaries that reflect subjective information expressed in multiple documents, such as product reviews. While the majority of previous work has focused on the extractive setting, i.e., selecting fragments from input reviews to produce a summary, we let the model generate novel sentences and hence produce abstractive summaries. Recent progress in summarization has seen the development of supervised models which rely on large quantities of document-summary pairs. Since such training data is expensive to acquire, we instead consider the unsupervised setting, in other words, we do not use any summaries in training. We define a generative model for a review collection which capitalizes on the intuition that when generating a new review given a set of other reviews of a product, we should be able to control the "amount of novelty" going into the new review or, equivalently, vary the extent to which it deviates from the input. At test time, when generating summaries, we force the novelty to be minimal, and produce a text reflecting consensus opinions. We capture this intuition by defining a hierarchical variational autoencoder model. Both individual reviews and the products they correspond to are associated with stochastic latent codes, and the review generator ("decoder") has direct access to the text of input reviews through the pointer-generator mechanism. Experiments on Amazon and Yelp datasets, show that setting at test time the review’s latent code to its mean, allows the model to produce fluent and coherent summaries reflecting common opinions.

1 Introduction

Summarization of user opinions expressed in online resources, such as blogs, reviews, social media, or internet forums, has drawn much attention due to its potential for various information access applications. As such, creating digests, search, and report summaries re...
The abstract of Bražinskas et al. (2020) takes up almost half a page. Can you shorten it to 125 words?

Opinion summarization is the task of automatically creating summaries that reflect subjective information expressed in multiple documents, such as product reviews. While the majority of previous work has focused on the extractive setting, i.e., selecting fragments from input reviews to produce a summary, we let the model generate novel sentences and hence produce abstractive summaries. Recent progress in summarization has seen the development of supervised models which rely on large quantities of document-summary pairs. Since such training data is expensive to acquire, we instead consider the unsupervised setting, in other words, we do not use any summaries in training. We define a generative model for a review collection which capitalizes on the intuition that when generating a new review given a set of other reviews of a product, we should be able to control the “amount of novelty” going into the new review or, equivalently, vary the extent to which it deviates from the input. At test time, when generating summaries, we force the novelty to be minimal, and produce a text reflecting consensus opinions. We capture this intuition by defining a hierarchical variational autoencoder model. Both individual reviews and the products they correspond to are associated with stochastic latent codes, and the review generator ("decoder") has direct access to the text of input reviews through the pointer-generator mechanism. Experiments on Amazon and Yelp datasets, show that setting at test time the review’s latent code to its mean, allows the model to produce fluent and coherent summaries reflecting common opinions.
Write a draft of the abstract of your replication report. Use Zobel’s guidelines and write one sentence each for:

1. A general statement introducing the broad research area.
2. An explanation of the specific problem to be solved.
4. An outline of the proposed new solution.
5. A summary of how the solution was evaluated and the result of the evaluation.
